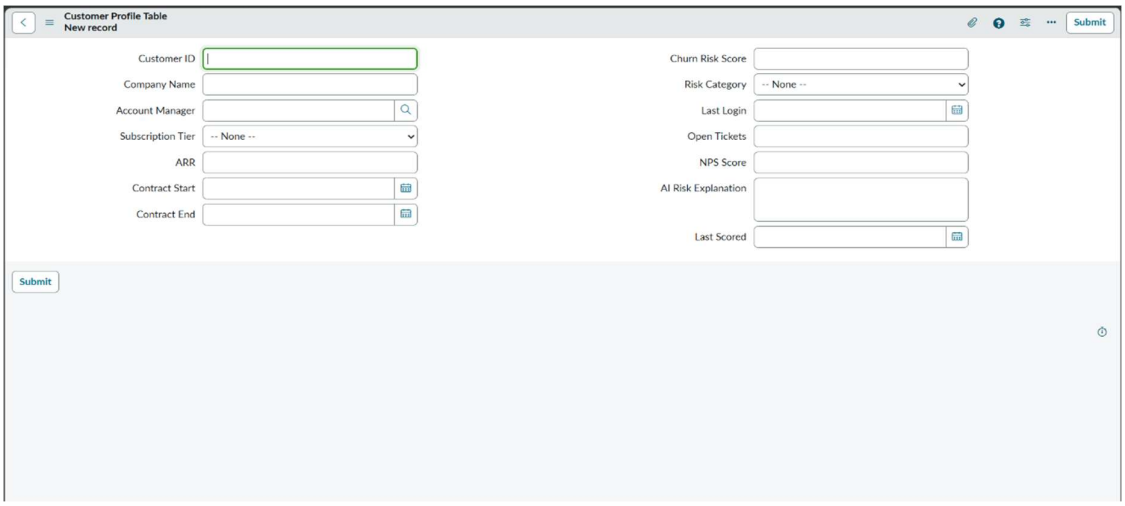
1. ServiceNow Tables Implemented

The following custom ServiceNow tables were implemented and configured during project development.

Implemented Tables

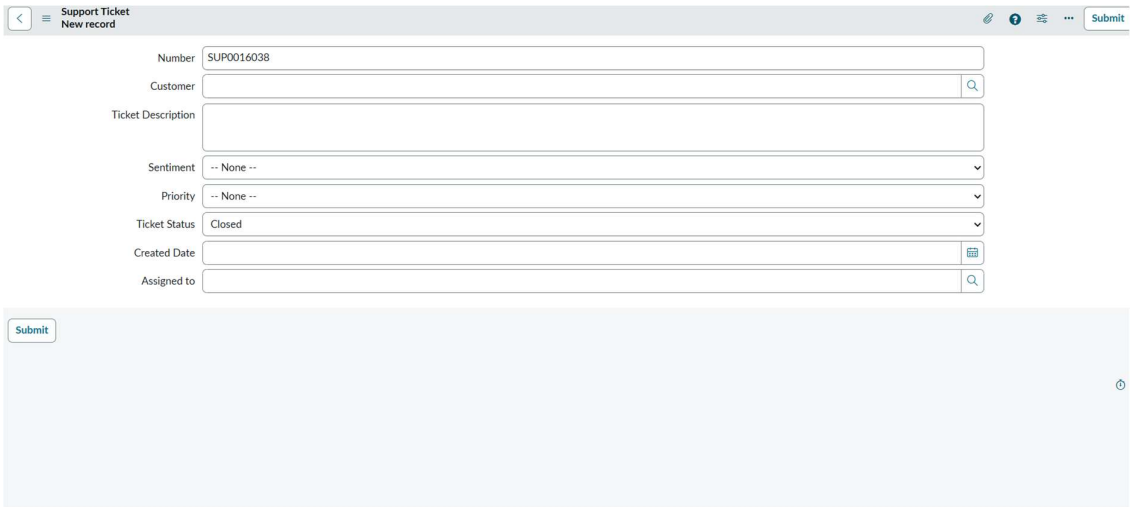
1. Customer Profile Table

Stores customer information, churn risk score, risk category, subscription details, and AI-generated risk explanations.



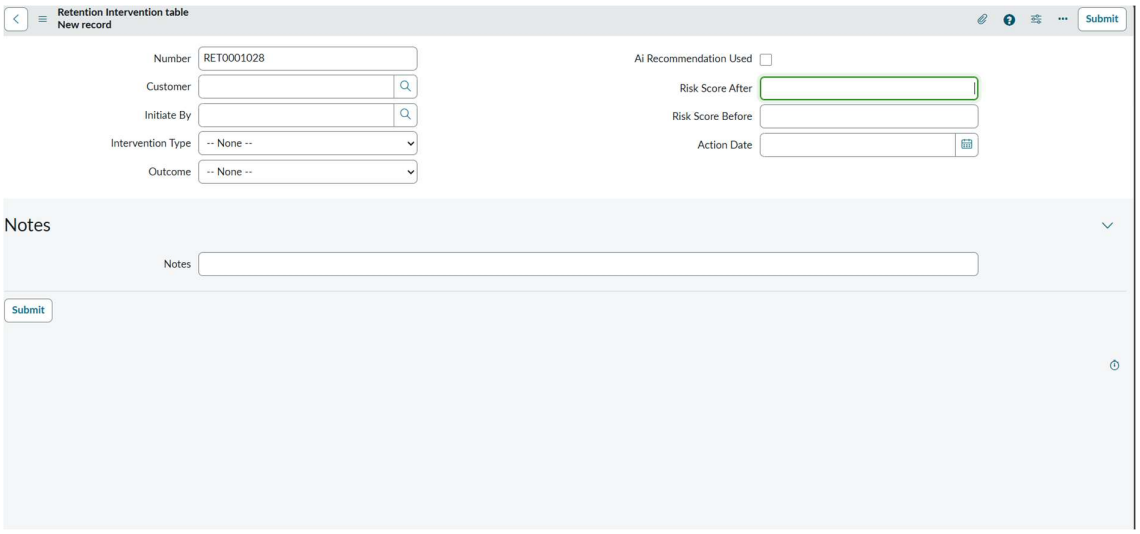
2. Support Ticket Table

Stores customer support interactions, ticket sentiment, priority, and ticket status information used for churn analysis.



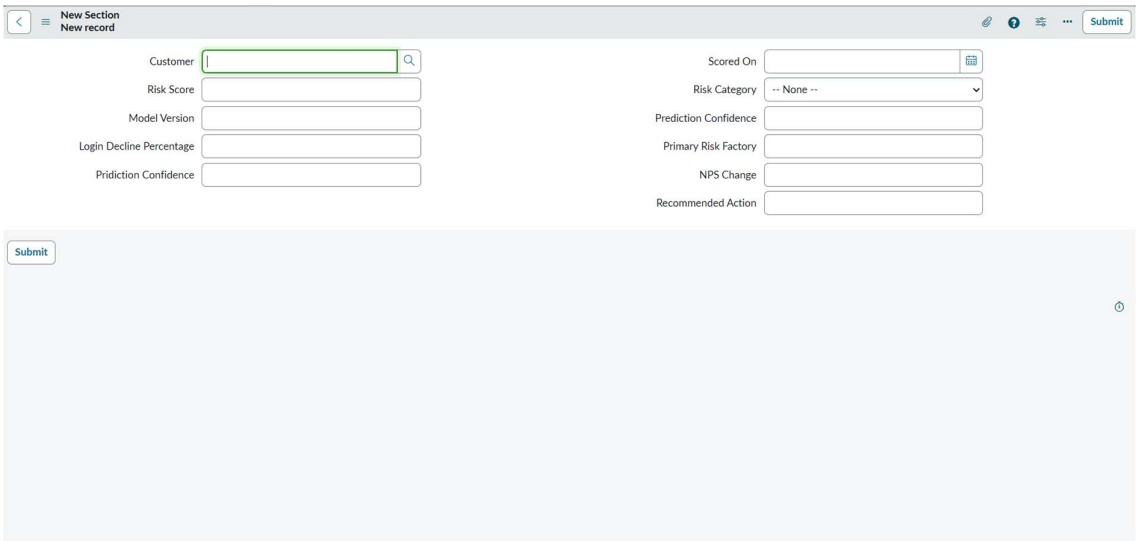
3. Retention Intervention Table

Stores automated retention actions and follow-up activities created for high-risk customers.



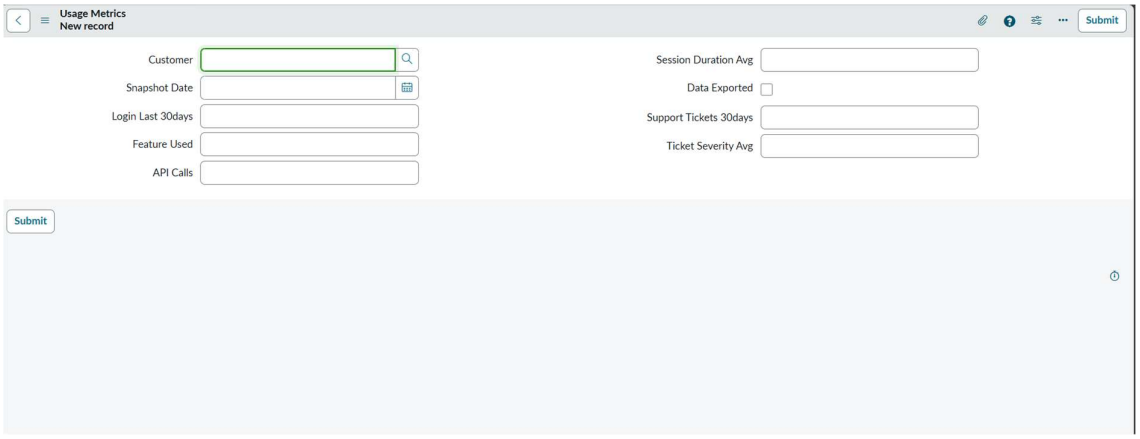
4. Risk Score History Table

Tracks customer churn risk score changes and maintains historical risk monitoring records.



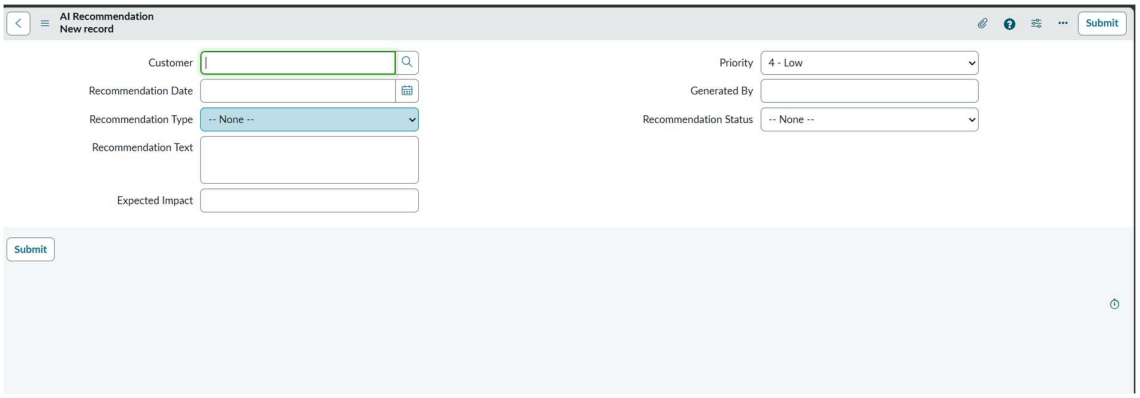
5. Usage Metrics Table

Stores customer usage activity, engagement metrics, and product usage information for churn prediction analysis.



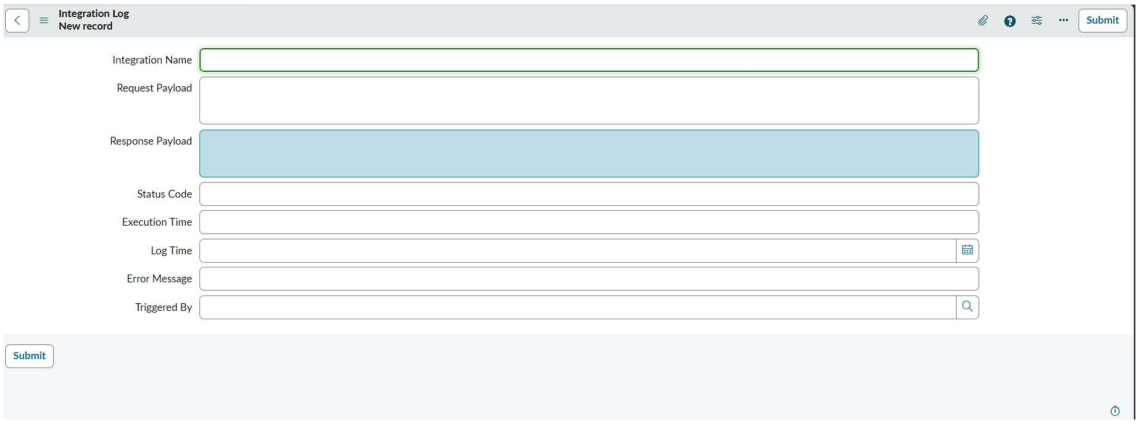
6. AI Recommendation Table

Stores AI-generated customer retention recommendations and risk explanation outputs.



7. Integration Log Table

Stores external integration activity, API synchronization logs, and workflow execution tracking information.



All tables were connected using reference relationships and integrated with Flow Designer automation, churn prediction workflows, and frontend dashboard components.

2. Flow Designer Implementations

The project uses ServiceNow Flow Designer to automate churn prediction workflows, customer risk escalation, and retention intervention processes.

Implemented Flows

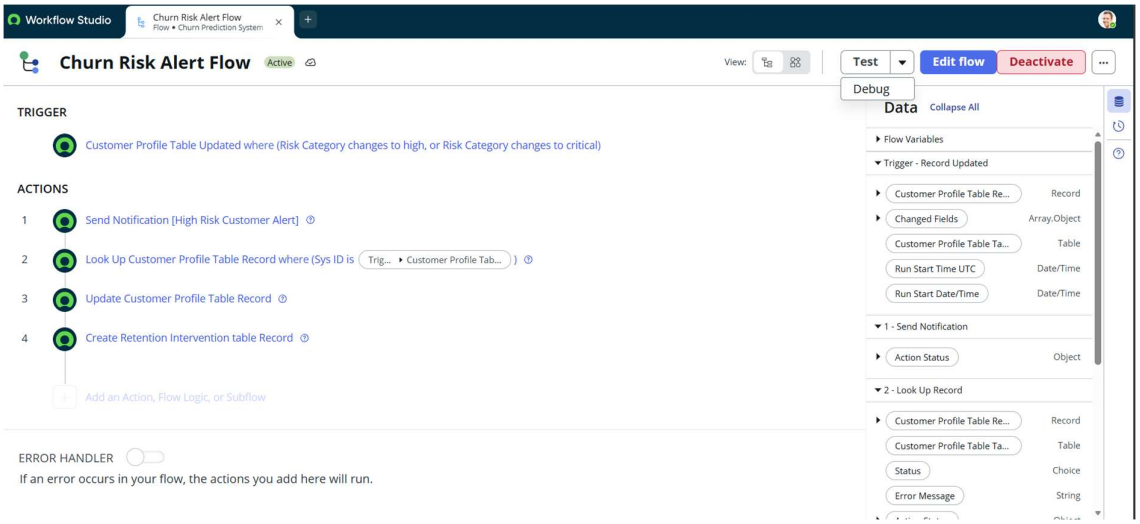
1. Churn Risk Alert Flow

Purpose:
Automatically creates retention intervention records when a customer becomes High or Critical risk.

Workflow:
Customer Risk Category → High/Critical → Retention Intervention Record Created Automatically

Main Actions:

- Monitor customer risk category
- Trigger automation workflow
- Create retention intervention record
- Store AI-based follow-up information



---

2. Support Ticket Risk Update Flow

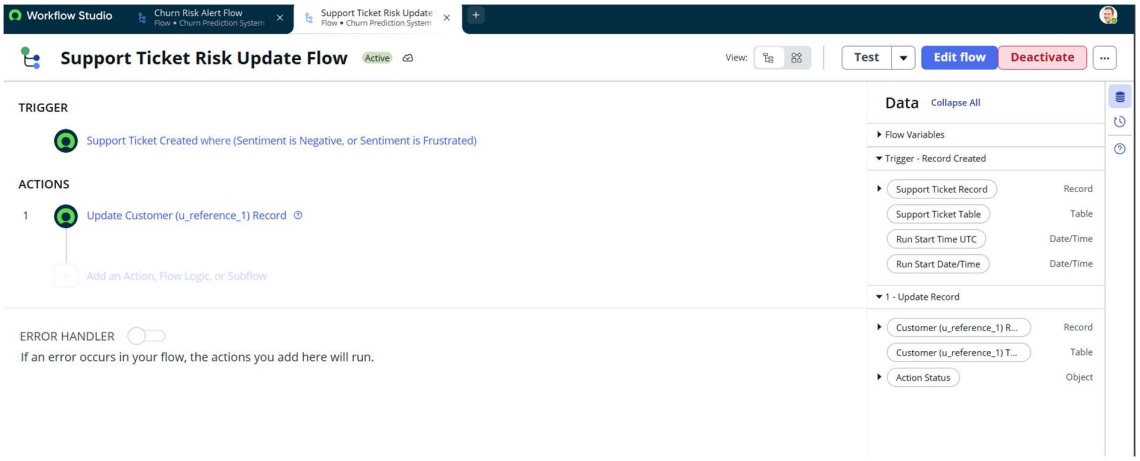
Purpose:
Automatically escalates customer churn risk when negative or frustrated support tickets are created.

Workflow:
Negative/Frustrated Support Ticket → Customer Risk Updated to Critical

Main Actions:

- Monitor support ticket sentiment
- Detect negative/frustrated customer interactions

- Update customer risk category
- Trigger churn escalation process



The flows were implemented using ServiceNow Flow Designer with automated triggers, conditions, and update actions connected to the Customer Profile and Support Ticket tables.

4. Frontend Dashboard & Monitoring

The project includes frontend dashboard components for monitoring customer churn risk, customer activity, retention interventions, and business KPIs.

Dashboard Features Implemented

Customer Risk Monitoring

The dashboard displays customer churn risk categories including:

- Low
- Medium
- High
- Critical

This helps account managers quickly identify high-risk customers.

KPI & Analytics Dashboard

The frontend dashboard provides:

- churn trend monitoring
- customer health tracking
- retention activity monitoring
- support ticket analysis
- intervention tracking

AI Recommendation Display

AI-generated customer retention recommendations and churn risk explanations are displayed directly inside customer profile records and dashboard views.

Support Ticket Monitoring

The system monitors customer support ticket sentiment and automatically reflects churn-related risk escalations in the dashboard and customer profile records.

Workflow & Automation Visibility

Dashboard records and forms display automated workflow actions including:

- retention intervention creation
- risk escalation
- support ticket tracking
- automated notifications

The frontend implementation provides a centralized interface for proactive customer retention management and churn analysis.

5. Workflow Execution & Automation Proof

The implemented ServiceNow workflows were tested using Flow Designer execution and debugging tools to verify successful automation behavior.

Verified Workflow Executions

Support Ticket Risk Update Flow

Execution Process:

1. A support ticket record is created.
2. The system checks ticket sentiment.
3. If sentiment is Negative or Frustrated:
    - customer risk category is automatically updated to Critical
    - AI risk explanation is updated
    - churn escalation workflow is triggered

Verified Output:

- Customer Profile record updated successfully
- Risk Category changed automatically

- AI Risk Explanation updated automatically

Churn Risk Alert Flow

Execution Process:

1. Customer risk category changes to High or Critical.
2. Flow Designer automatically triggers retention workflow actions.
3. Automated notification process starts.
4. Retention intervention record is created automatically.

Verified Output:

- Notification workflow triggered successfully
- Customer record lookup completed
- Retention intervention record created successfully

Automation Verification

The workflows were verified using:

- Flow Designer execution logs
- Debug mode execution
- Record update validation
- Automated intervention record creation

The implementation confirms successful workflow automation and end-to-end churn management functionality inside the ServiceNow platform.
